in this project i chose to only remove height, while there may very well be a correlation between height and taste in music, i doubt that the impact would be very big.

i chose to not attribute any special difference between cities but to increase the weight of city name, age and music style, the goal is the create a metric axed toward the preference of music related to the city (with age having a minor increase in weight), I know that this choice might seem weird, but since some part of the country use different words to describe the same thing (ex: pain au chocolat), I thought it would be interesting.

i chose to create artificial closeness between the following jobs [designer, painter] | [developer, engineer]

and to do the same between the following music styles [hiphop, rap], [rock, metal, technical death metal]

These being similar in a lot of ways, I preferred to give them a "half wrong" weight, as it seemed appropriate
